L&D REALITY CHECK

5 Signs Your Training Is Just Expensive Decoration

High budget ≠ high impact

AppletPod

01

High production value, low completion

Slick videos. Professional voiceover. Interactive timeline. Completion rate: 22%. The polish doesn't fix the problem - learners still aren't finishing.

Production quality and learning design are different disciplines.

02

You measure completion, not performance

Dashboards show who finished modules. But can learners actually do the skill? If your metrics stop at completion rates, you're measuring engagement theater.

Completion is a vanity metric. Behavior change is the real measure.

03

Generic content for specific roles

One course for sales, engineering, and operations. Everyone gets the same examples. Nobody sees their actual job reflected. Content that fits everyone fits no one.

Role-specific practice beats generic explanation every time.

04

Content-heavy, practice-light

20 slides explaining the concept. 2 quiz questions at the end. Learners can recite the theory but can't apply it under pressure. Knowledge ≠ skill.

⚡ **High-value skills require exploration, not explanation.**

05

AI speeds up content, not behavior change

You're using AI to generate 10X more slides. Completion rates haven't moved. AI accelerates the wrong layer - it should power practice systems, not content pipelines.

AI at the simulation layer, not the authoring layer.

What actually works

- Practice environments where learners adjust variables and see consequences
- Performance metrics tied to actual job outcomes, not completion
- Role-specific simulations built from real workflow data

Stop decorating. Start building practice systems.

I build interactive learning experiences in 3-4 weeks.
