INTERACTIVE LEARNING

5 Ways Interactive Content Beats Video

After shipping 100+ applets, here's what I've seen work.

AppletPod

01

Active Recall vs Passive Watching

Videos let learners sit back. Interactive applets force them to manipulate, predict, and test. The brain encodes 3x better when hands are involved.

Watching a fractions video ≠ dragging fraction bars to discover equivalence yourself.

02

Instant Feedback Loops

In a video, you wait until the quiz at the end. In an interactive applet, every action gives immediate visual feedback.

Move a slider → see the graph change → understand the concept. No waiting.

03

Self-Paced Exploration

Videos run at one speed for everyone. Interactive content lets fast learners skip ahead and struggling learners spend more time where needed.

Same applet, different learning paths. That's real personalization.

Retention That Lasts

~10% Lecture retention after 24 hours

~20% Video retention after 24 hours

~75% Interactive practice retention

Measurable Learning Signals

- Video metric: "watched 80%"
- Interactive: manipulation patterns
- Interactive: time-per-concept
- Interactive: misconception maps
- You can't improve what you can't measure

Building EdTech? Let's talk interactive.

I help companies ship interactive learning products in 3-4 weeks, not months.
